Dimming characteristic

0-5V negative logic endless dimming color temperature:

- Connect 0-5V DC voltage between DIM+ and DIM- to adjust the value of the output constant current;
- Connect 0-5V DC voltage between CT+ and DIM- to adjust the current output of the two channels to adjust the color temperature;
- Typical consumption current of dimming/color temperature line: 10V/10uA, about 600K Ω high input impedance;

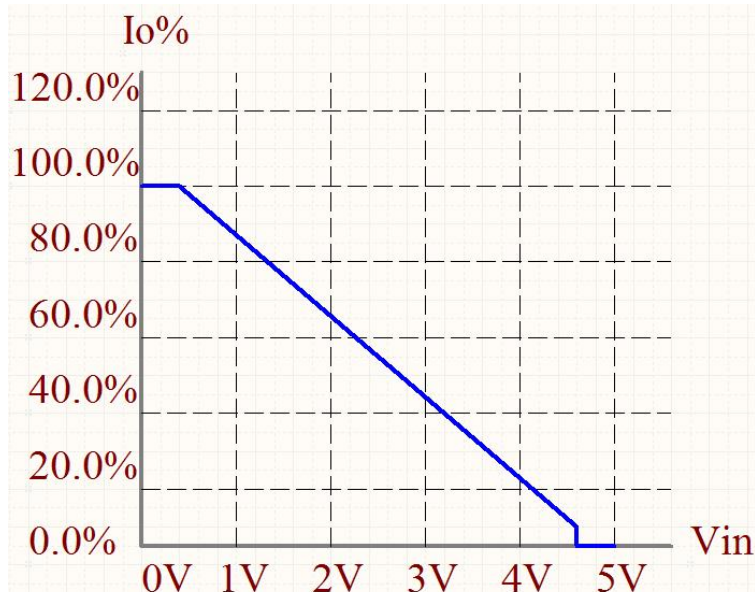

0-5Vdc dimming curve

0-5Vdc dimming

■ Apply an external voltage of 0-5Vdc

Do not connect "DIM-" to "V-"

Color temperature curve

0-5Vdc color temperature

Protections

Protection	description
under-voltage protection	When the input is less than $170 \pm 15\text{Vac}$ / $240 \pm 20\text{Vdc}$, the output power drops to $50\text{W} \pm 20\%$, when the input is higher than $180\text{Vac}/255\text{Vdc}$ again, it returns to 100W full power.
Output overload protection	Protection mode:hiccup mode,and recovers automatically when the fault condition is removed.
Output short circuit protection	Hiccup mode,and recovery automatically when the fault condition is removed.
Over temperature protection	Self-restorable type; When the shell temperature is greater than 90°C , the output power decreases with the increase of the shell temperature.
Output over-voltage protection	Protection mode:Hiccup or clamp at a certain output highest voltage state, the product will not be damaged, when the fault is removed, the driver works normally

Note:

1. Unless otherwise specified, all parameters should be measured at the condition of 230Vac (50Hz) input ,with rated load ,and ambient temperature of 25°C ;
2. Including setting error, linear adjustment rate and load adjustment rate;
